Is the Video game industry declining?

Every year at Christmas time my brother used to rush down stairs waiting for the latest version of one of the consoles that were released that year. They also hoped for the latest video game to pop in and go along with them. Video games have been around for almost 70 years capturing the mind of our people. There have been many popular remakes and changes made to the consoles from the super Nintendo having the big bulky games to insert on the top of the console. Then they made dick for the Xbox and playstations, and innuendo switch. The upgraded models you can play them on your phone and download them off the web or some play store. Have this made a decrease in actually buying of video games sales? Are cellphones and the digital games take over the video game industry? Is the video game industry declining? There are multiple problems that can be solved with this data. The first is are companies creating successful games. By the analysis of this data I can decide is the video game industry declining. The data also have the category of each type of games, therefore I can decide should a company sell more games similar to this one. They could also decide on to improve the game if it didn't do good in sales the previous years. The clients would be companies such as Sony Nintendo and other. These problems are important to keep the company from losing money, and to make observations so that the company can see the need for improvement, adjust and make more money. The data set that will be used is a kaggle data set for video game sales for 2019 and a data set contains the names of the games, the year, make the console and the model. These three data sets have data from the year from 2014 - 2019. I will be delivering the data in a poster presentation.
